

Region of York Transit Improving Air Quality

Media Release

York Region Transit has recently placed an order with Tadger Group International for its product to assist them in improving the air quality of York Region.

To date, York has provided it's residents with efficient transportation to a growing and vibrant community. With this most recent initiative, the strength in community leadership and stewardship of the environment takes a further step forward.

Peter Chatoff, Fleet Co-ordinator confirmed the reduction in toxic emissions and lowering of soot levels was significant enough to warrant installation on a number of the Region's Paratransit " Mobility Plus" and Community bus units. In addition, further testing through select installations will occur across various older models of the Region's fleet of full sized conventional buses.

The Tadger Group International testing indicates that the device significantly reduces airborne toxic emissions such as Carbon Monoxide, NOx and Carbon Dioxide from any diesel or gas combustion engine. Reductions of 50% are not uncommon to this product as verified by independent laboratory testing. In fact, recent environmental testing produced a reduction of 89.8% in opacity (soot) as verified by Ontario Drive Clean. Company President Mr. John Mogford states "It is the mission of Tadger to significantly reduce airborne toxic emissions from combustion engines throughout the world." Tadger's are now available in Greece, China, the United States and a number of African countries. This Canadian owned and operated company manufactures in Canada and leads the world in innovative technology in the field of emission reductions at low cost.

The lifespan of the Tadger is infinite as it contains no moving parts, needs no maintenance and can be easily transferred from an old engine to a new engine, thereby eliminating the need to purchase more than one for any engine. Significant improvements in mileage are also noted when the Tadger is in operation. Some fleets are finding savings of between 4 - 8% in annual fuel expenses.

With this product installed on some units in the transit fleet, York Region will benefit from cleaner air to your children and ours. If you wish further information regarding this device, please contact Mr. John Mogford at 905-308-0331 and he would be pleased to work with your company to better your environment.
